

Output variables : $d_i \rightarrow$ delay of i th job

$d_m \rightarrow$ max delay

$\bar{d} \rightarrow$ average delay

$c_5 \rightarrow$ # of jobs with more than 5 min delay

$C_e \rightarrow \# \text{ of job left}$

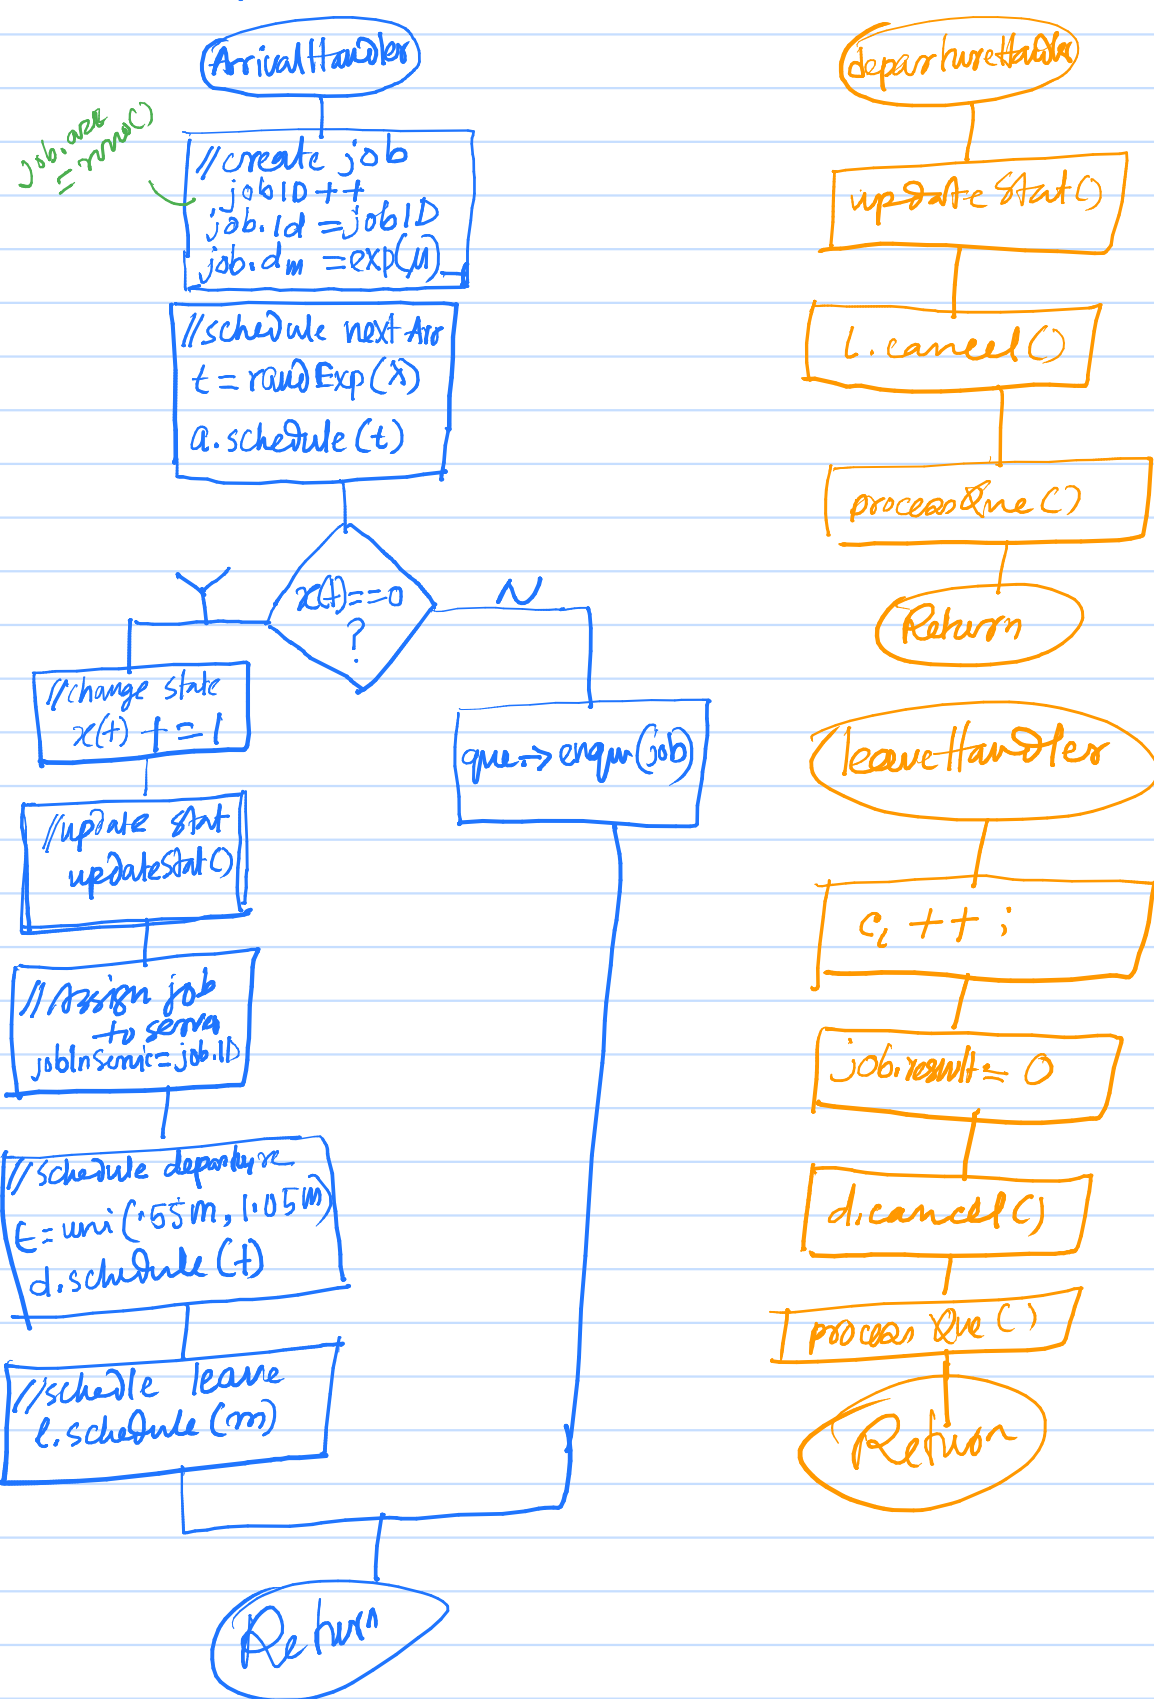

$c_4 \rightarrow \#$ and other jobs.

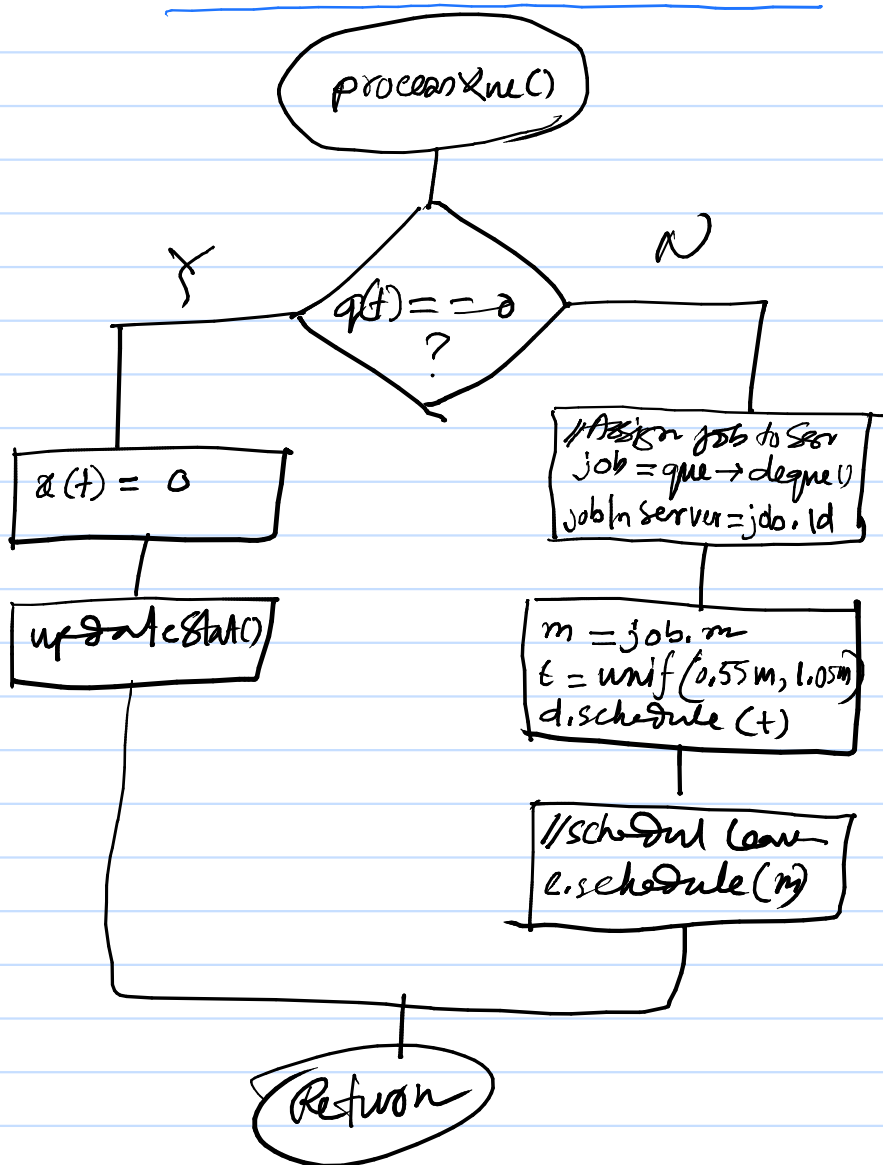

5

$$x(t) = \begin{cases} x(t) + 1, & \text{if arrival occurs and } x(t) \neq 0 \\ x(t) - 1, & \text{if departure occurs and } q(t) \neq 0 \\ x(t), & \text{otherwise} \end{cases}$$

$$q(t) = \begin{cases} q(t) + 1, & \text{if arrival occurs and } x(t) = 1 \\ q(t) - 1, & \text{if departure occurs and } q(t) > 0 \end{cases}$$

d) $S = \{ (0,0), (1,0), (1,1), (1,2), (1,3), \dots \}$

b) Output equation

$$\bar{d} = \sum_{i=1}^{c_t} d_i \Rightarrow \text{avg delay}$$

$$d_{\max} = \max_i (d_i) \Rightarrow \text{max delay}$$

$$c_5 = \sum_{i=1}^{c_t} I(d_i) ; I(d_i) = \begin{cases} 1, & \text{if } d_i > 5 \\ 0, & \text{otherwise} \end{cases}$$

$$P = \frac{c_5}{c_t} \Rightarrow \text{Proportion of jobs with more than 5 min delays.}$$
